(54) IMAGE DISPLAY DEVICE AND ITS DRIVING METHOD

(57)Abstract:

PURPOSE: To obtain the brightness of a thin-film pixel element faithful to input video signals by specifying input voltage and the current flowing to a nonlinear element for controlling light emission to a primary proportional relation.

CONSTITUTION: This image display element has, in every one pixel, the thin-film pixel element, the nonlinear element for controlling the light emission of the thin-film pixel element, a capacitor for signal holding connected to the gate electrode of the nonlinear element, a nonlinear element for writing data to this capacitor, a second nonlinear element 2 having the characteristics similar to the characteristics of the nonlinear element for controlling light emission and a reference conversion section 1 for inputting the image signal VLo adjusted by referring to the output of the second nonlinear element 2 to the nonlinear element for controlling light emission.

LEGAL STATUS

[Date of request for examination]

[Date of sending the examiner's decision of rejection]

[Kind of final disposal of application other than the examiner's decision of rejection or application converted registration]

[Date of final disposal for application]

[Patent number]

[Date of registration]

[Number of appeal against examiner's decision of rejection]

[Date of requesting appeal against examiner's decision of rejection]
